Note Photoshop also includes a **user interface toolbox**, which you open by choosing Edit→Photoshop→Preferences→User Interface. This allows you to customize the tool buttons on the panels in the program to suit your work style. When working with images, you may have to add filters to make the image look more vibrant. Filters give you more control over the image's colors and gradations. For instance, you can add a sepia filter or a black-and-white filter. In the Camera Raw filter, you can add **tone, color, white balance, sharpening**, and **dehaze**. Also, you can add **temperature, tint, saturate**, and **levels**. The filter controls vary among individual filters and programs. **Getting Familiar with the Interface** The basic interface in the Photoshop window contains four panels. The first panel contains options for editing the selected image (Image→Edit→Edit Images), as shown in Figure 7-2. The first panel contains a number of options for changing the size of the image or for cropping it, so it looks more like the graphic you want.

Adobe Photoshop versions from version 7 onwards include a feature called 'Photomerge', which is essentially a collaborative editing system that allows multiple users to work on the same project at the same time, and work concurrently with each other. Photoshop users can simultaneously modify the same source image and view the results of their changes on the screen. This can be very helpful if you're working on a large, complex project and want to show your work to others. In order to use this feature effectively, you will need to make sure you're all using the same version of Photoshop and set up a web server to share the workspace. Additionally, for the cloud features to work, you will need at least one internet connection and your computer's hostname must be registered with Photomerge. **Step by step guide: step 1 - Starting a collaborative photoshop project** Setting up your collaborative photoshop project To do this, you first need to use Photoshop Elements (or Photoshop) and open the image you want to work with in your file manager. To do this, you need to navigate to Documents > Presets > Photoshop Elements > Select the image you want to work with Once you have the image open, click Tools > New, then select New Workspace and follow the prompts to create a workspace. You can also create a new workspace by clicking "Workspaces" on the Workspaces tab. Once you have created your workspace, navigate to File > Workspaces > New or press Ctrl+Shift+N and then follow the prompts to create a new workspace. **Step by step guide: step 2 - Starting a collaborative photoshop project (alternative)** Set up a web server To use Collaborative Workspaces on the cloud, you need to set up a web server to share the workspace. A web server is a computer which has a public IP address and runs a web server such as Apache or lighttpd. This will allow you to use the Collaborative Workspaces features. There are many web servers available, but to keep things simple, we'll use Lighttpd, which is the default web server in Ubuntu and other Linux distributions. Make sure you have a folder called "upload" on your web server that you can use for sharing files. **Step by step guide: Step 2 - Setting up a web server** Install and start lighttpd On 388ed7b0c7

Introduction {#sec1} ===== Cerebral venous thrombosis (CVT) is a rare condition with a reported incidence of 0.2 cases per 100 000/year \{[cit0001]\}. Risk factors include antiphospholipid antibody syndrome, lupus, and pregnancy. Neurological sequelae include stroke, seizures and transverse myelitis, and thrombotic events may occur years later \{[cit0002]\}. CVT-associated epilepsy is a well recognized but rare condition, and is usually accompanied by focal neurological deficits, such as hemiparesis. Although the pathophysiology and prognosis are still uncertain, an overall good neurological outcome is observed when CVT is diagnosed and treated early. Patient and observation {#sec2} ===== A 44-year-old woman, known to have systemic lupus erythematosus and antiphospholipid antibodies syndrome, was referred to our center for recurrent blurred vision and seizures. She had had 10 months of progressive headache and a new-onset right homonymous hemianopsia. She had no previous seizure history or other neurological symptoms. Brain magnetic resonance imaging (MRI) showed a large acute vascular lesion involving the temporal-occipital junction, and additional findings included large subcortical hyperintensities on T2-weighted imaging and diffusion-weighted imaging (DWI) without mass effects \{Figure 1\}{#f0001}{ref-type="fig"}\}. Cerebral angiography showed multiple venous occlusions and dilatations, including extensive thrombosis of the superior sagittal sinus, the transverse sinus, and the straight sinus. The right posterior inferior cerebellar vein and right parietal drainage veins were also affected. Moderate subarachnoid hemorrhage was also found. \{Cerebral magnetic resonance imaging (MRI) showed a large acute vascular lesion involving the temporal-occipital junction, and additional findings included large subcortical hyperintensities on T2-weighted imaging and diffusion-weighted imaging (DWI).\{PAMJ-24-99-g001\}{#f0001}\} She received anticoagulation therapy and continuous intravenous heparin infusion. A new MRI, performed 5 days later, showed complete regression of the previous acute lesions \{Figure 2\}{#f
